                                                      g
                                                                                                                                                          The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune hamolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1053 TCTTAACACTCAGTCTAAGATTGCTTAGTCCCCAGTATCACAGTGGCAGCTGTACAGTCT 1112

The invention relates to novel isolated human prostate cancer antigen polynocleotides (I) and polypeptides (II). (I) and (II) are useful for preventing, treating or ameliorating a medical condition when administered. (I). (II) and the antibody to (II) are useful for treating, preventing and/ or prognosting disorders related to the reproductive system including prostate cancers; urinary disorders e.g. chronic nephritis; and blood-related disorders e.g. thrombosis. (II) can be used for testing and detection e.g. as a chromosomal marker and in forensics. (I) and the anti-(II) antibody can be used in testing and detection in immunoassays. AAS40061-AAS4075 represent the human prostate cancer antigen coding sequences, and related PCR primers and sequences of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly.from WIPO at: ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  549 GGGGTTTCACCGTTTTAGCCGGGATGCCCTCGATCTCCTGACCTCGTGATCCGCCCCCT

/note_TGAP_DIO is a cDNA library containing the following tissue(s): A pool of Lung Focal Fibrosis. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first strand cDNA contains a library tag sequence that is located between the Not I site and the (GT)B tail. The sequence tag for this library is

```

with an cligc-dT primer containing a Not I site. Double stranded cDNA was ligated to an ECOR I adaptor, digested with Not I, and cloned directionally into pyTyT3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The TAG_LIB=UI-H-DFO TAG_LIB=UI-H-DFO TAG_LIB=UI-H-DFO TAG_LIB=UI-H-DFO TAG_LIB=UI-H-DFO TAG_CIB=UI-H-DFO TAG_CIB-UI-H-DFO TAG_CIB

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                       | SIDSI/goddata/geneseq/geneseqn-embl/NA1980.DAT:*

The present sequence is the coding sequence of the human KLK-LZ gene, which encodes a kallikrein-like protein. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding KIR-LI, KIK-LZ, KIK-LZ, KIK-LZ, KIK-LZ, KIK-LZ, KIK-LZ, MIK-LZ, MIK-LZ, MIK-LZ, MIK-LZ, and monitoring and diagnosis of cancers, especially prostrate cancer. They monitoring and diagnosis of cancers, especially prostrate cancer. They mediate the biological activity of the proteins. Antibodies can be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins.
                                                 (KLK-L) proteins for diagnosing and orders, especially cancer.
                                                                                                                                  Page 143-149; 184pp; English

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in activity and can be used in gene therapy. MI can be used for screening anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the structure and/or properties of the agent. MI can be used in the creatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adencer, or adencerinoma, carcinoma, clear cell cancer, infilitrating ductal cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1590 CAGGGTGATTCTGGGGGGCCTGTGGTCTGCAATGGCTCCCTGCAGGGACTCGTGTCCTGG

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 93% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening in the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the structure and/or properties of the agent. MI can be used in the structure and/or properties of the agent. MI can be used in the creatment of cancer such as colon, breast, stomach, lung, thyroid, cospobhageal, ovarian, kidney, prostate or pancreatic cancer, infiltrating ductal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1590 CAGGGTGATTCTGGGGGGCCTGTGGTCTGCAATGGCTCCCTGCAGGGACTCGTGTCCTGG 1649

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polypeptides. The sequences are useful for treating cancer, preferably breast cancer, in a patient or for stimulating an immune response. The polynucleotides and polypeptides are also useful in the diagnosis and monitoring of breast cancer. A method for detecting the presence of a cancer in a patient, comprises obtaining a biological sample from the patient, contacting the biological sample with a binding agent that bind to a breast tumour polypeptide, detecting in the sample an amount of polypeptide to a predetermined cut-off value, therefore determining the presence of a cancer in the patient. Sequences ABK29020-ABK29025 represence of a cancer in the patient. Sequences ABK29020-BEK29025
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; breast tumour polypeptide; gene; ss; breast cancer; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence was isolated from a breast tumour cDNA library. It is provided in a specification relating to compounds for immunotherapy and diagnosts of breast cancer. Breast tumour antigens and the polynucleotides that encode them may be used in the production of a pharmaceutical composition to be used in the treatment of breast cancer. Proliferated T cells and incubated antigen presenting cells are also required. The polypeptides and polynucleotides may also be used to
A novel isolated polypeptide comprising an immunogenic portion of a breast cancer protein useful in the detection and treatment of breast

                                                                                             This sequence encodes a human breast tumour protein immunogenic fragment of the invention. The polypeptides or nucleic acids encoding them are useful in vaccines and pharmaceutical compositions for manufacture of medicaments for inhibiting the development of breast cancer in a patient. They can also be used to treat breast cancer. Antibodies against these polypeptides can be used to detect and monitor progression of breast polypeptides can be used to detect and monitor progression of breast encoding the breast proteins are useful for detection of breast cancer. Peripheral blood cells from a patient incubated in the presence of at least one polypeptide, such that T cells proliferate, are useful in manufacture of a medicament for treating breast cancer in a patient. Antigen presenting cells incubated in the presence of at least one polypeptide are also useful for treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       203 GTCTGCTTCCCCCACATTGGGCTGACGTGTCTCTCTAGTTGAACCCTGGGAACAATTC

                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is a BS247 specific polynucleotide.

The invention relates to a method of detecting the presence of a target BS247 polynucleotide, especially mRNA, in a test sample. BS247 polynucleotides are derived from breast tissue. The polynucleotides, polynucleotides are useful for providing information leading polynucleotides are useful for providing information leading polynpeptides or antibodies are useful for providing information leading to the detection, diagnosis, staging, monitoring, prognosis, in vivo imaging, prevention or treatment, determining predisposition to, diseases and conditions of the breast, such as breast cancer, atypical hyperplasia, fibroadenoma and cystic breast disease. Drug treatment or gene therapy for breast cancer, can be based on these identified gene sequences and the efficacy of any particular therapy can be monitored. The BS247 derived reagents are advantageous for detection of breast cancer due to their specificity. The reagents also provide an alternative, non-surgical diagnostic method capable of detecting early stage breast disease, such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

This sequence is a BS247 specific polynucleotide.

The invention relates to a method of detecting the presence of a target BS247 polynucleotide, especially mRNN, in a test sample. BS247 polynucleotides are derived from breast tissue. The polynucleotides or antibodies are useful for providing information leading to the detection, diagnosis, staging, monitoring, prognosis, in vivo imaging, prevention or treatment, determining predisposition to, diseases and conditions of the breast, such as breast cancer, atypical hyperplasia, fibroadenoma and cystic breast disease. Drug treatment or gene therapy for breast cancer, can be based on these identified gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cancer due to their specificity. The reagents also provide an alternative, non-surgical diagnostic method capable of detecting early
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequences and the efficacy of any particular therapy can be monitored. The BS247-derived reagents are advantageous for detection of breast

This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number is given in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human numunoglobulin Fer portion (e.g. AAZ06210) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 36 novel genes and their fragments (nucleic acid sequences: AAZ06219_206263; amino acid sequences AAY3848). Which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in polypectides. Specific uses are described for each of the 36 polynucleotides, based on which tissues they are most highly expressed in (see AAZ06219 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2009

                                                                                                                                                                                        This DNA encodes a human keratinocyte derived protease (KDP) polypeptide. The protease is substantially similar to a sequence encoded by the insert in plasmid FERM BP-6129. The KDP polypeptide, from human keratinocytes, is specifically used in skin care products, particularly to treat or prevent skin flaking, e.g. dandruff, and in laundry detergent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Keratinocyte derived protease; KDP; protease; keratinocyte; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               secreted human protein. The gene number is given in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. ARZ06210) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 36 novel genes and their fragments (nucleic acid sequences: ARZ06219-Z06263; amino acid sequences ARX78386*738498) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 36
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1590 CAGGGTGATTCTGGGGGGCCTGTGGTCTGCAATGGCTCCCTGCAGGGACTCGTGTCCTGG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1156
                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number is given in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene stability of the fused protein as compared to the human numunoglobulin Fc portion (e.g. AAZ06210) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 36 novel genes and their fragments (nucleic acid sequences: AAZ06219-Z06263; amino acid sequences AAY38386-Y38498) which are useful for preventing, treating or ameliorating medical conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 36 polynucleotides, based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1590 CAGGGTGATTCTGGGGGGCCTGTGGTCTGCAATGGCTCCCTGCAGGGACTCGTGTCCTGG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1590 CAGGGTGATTCTGGGGGGCCTGTGGTGCTAATGGCTCCCTGCAGGGACTCGTGTCCTGG 1649
                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequences have homology with proteins including LDL receptors, TIE ligands and various enzymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially
                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1077 CAGGGTGATTCTGGGGGGCCTGTGGTCTCCCATGCTCCCTGCAGGACTCCTGTGTCCTGG

ARS21244-AAS21518 encode for novel human secretory and transmembrane PRO polypeptides are useful to detect other PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to Indulate biological activities of cells expressing PRO polypeptides, to modulate biological activities of cells expressing pRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation of chondrocytes, the proliferation of inner ear utricular supporting cells or cartilage, the release of a cytokine from peripheral blood monocytes (PBMCS), or the proliferation of endothalial cells. Some of the PBO control of the PRO control of Endothalial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1889

```
The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of biocactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44470 to AAF44470 represent PCR primers and hybridistation probes used in the isolation of human PRO sequences. AAF44087 to AAF44269 and AAB65154 to AAB65300 represent human PRO polynucleotide and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DL;
